

New Power

Quarterly Report: March 2024

Strategy Description

Growth of 1,000

The New Power strategy, at its core, is an impact investing strategy. New Power has a fundamental goal to have a positive impact with the investments we choose. New Power has roots in emerging technology, clean energy production models, industry game changers and incumbent-disruptors. We see the current investments of New Power falling into two broad categories, Energy Evolution and Sector Innovation.

Along with earning a risk-adjusted return greater than the benchmark, we seek to provide industry support to sectors we see as effective positive change makers. Be they established or emerging industries, we are supporting the companies and technologies that we feel have positive social and environmental impact.

Up to 10% of net revenue generated by the New Power strategy is donated to local non-profit organizations whose missions and diverse research align with our values. We believe in putting not only our investments but our revenue with the science that we believe in.

Description of the Technical Terms Used in this Report

Alpha: The premium an investment portfolio earns above a certain benchmark. A positive alpha indicates that the investor earned a premium over that index.

Benchmark: The benchmark used in this report is the Powershares Wilderhill Clean Energy ETF - (PBW) which is an equal-weighted, non-leveraged, passively managed equity ETF with the benchmark index of Wilderhill Clean Energy Index.

Benchmark Relevance: The Powershares Wilderhill Clean Energy ETF (PBW) was selected as a relevant benchmark to our New Power strategy for several reasons. First, the PBW was the only index proxy in the clean energy sector available at the inception of our New Power strategy back in late 2003. Second, PBW continues to be the most relevant comparison to this strategy on the basis of a high correlation to our past performance using a rolling 5 years of historical data as our basis. Finally, at least 50% of the New Power strategy remains focused on the niche of clean and renewable energy sources and their associated products, services and technologies; Thus, the name New Power.

Beta: The measurement of a dependent variable's (portfolio) volatility relative to an independent variable (benchmark). Beta is the percent change in the price of the dependent variable given a 1% change in the independent variable. This reveals to what extent the dependent variable moves in step with the independent variable, where a beta of 1 indicates perfect alignment.

Compound ROR: The annualized rate of return that has been compounded since inception.

Correlation: The degree to which the fluctuations of one variable are similar to those of another.

Cumulative Return: A rate of return that has been compounded for more than one year.

Cumulative VAQI (Growth of \$1000): The Value Added Quarterly Index (VAQI) reflects the growth of a hypothetical \$1,000 in a given investment over time.

Down Capture Ratio: The ratio of the compound index return from periods when the benchmark is down to the compound benchmark return using the same periods.

Outperformance/Underperformance: Performance relative to a benchmark. Higher than benchmark is Outperformance. Lower is Underperformance.

Required: A correlation term describing the variance in the dependent variable that can be explained by the independent or explanatory variable. The coefficient of determination (R-squared) is a pure number ranging 0 to 1, with 1 giving perfect correlation and 0 giving perfect non-correlation. It is often used to describe the amount of investment risk in portfolios that can be associated with market risk.

Sharpe Ratio: A reward of a portfolio's excess return relative to the total volatility of the portfolio.

Sortino Ratio: Similar to the Sharpe Ratio but only takes downside volatility into account.

Standard Deviation: A measure of the degree to which an individual probability value varies from the distribution mean. The higher the number, the greater the risk.

Up Capture Ratio: The ratio of the compound index return from periods when the benchmark is up to the compound benchmark return using the same periods.

All Season Financial Advisors Disclosure Statement

**** FOR INTERNAL USE ONLY - UNAUDITED PERFORMANCE FIGURES ****

This report is not an advertisement and is not intended for public use or distribution and is intended exclusively for use by the person to whom it has been delivered by All Season Financial Advisors, Inc. ("ASFA"). The information contained herein is confidential and proprietary, and generated for internal review of risk and return assessments of our investment strategies at the request of the recipient, for informational purposes.

It is for use solely by the intended recipient and may not be reproduced, distributed, shared, altered or published in any manner without the prior written consent of ASFA. All information may be modified, terminated or supplemented at any time without further notice. All figures contained herein are unaudited estimates based upon available records, which may include Composite Performance results generated from third parties. While all information is believed to be accurate, ASFA makes no warranty as to the completeness, currency, or accuracy of such information, and does not undertake to make updates, nor does it accept responsibility for errors, including information provided by third parties, appearing herein.

Composite performance results reflect time-weighted rates of returns of a composite of actual portfolios, which have traded securities based upon ASFA's proprietary trading strategies. Whenever possible, we attempt to use accounts with no additions or withdrawals. Accounts are excluded from the composite according to our Account Exclusion Policy below. Results from these excluded accounts may differ substantially from the composite. In some cases, we rely on only 2 or 3 actual accounts for the calculation of the composite return which are accounts we believe to be historically representative of the ASFA portfolio strategy during the corresponding time period. Performance results reflect the deduction of management fees and transaction fees. Treatment of dividends (reinvested versus distributed) has been variable throughout the historical performance shown. Management fees range between 0.75% and 2.0% of assets depending on the size of the account and are calculated quarterly based on the market value balance at the beginning of the quarter. Historical performance results for investment indices and/or categories generally do not reflect the deduction of transaction and/or custodial charges, nor the deduction of an investment management fee, the incurring of which would have the effect of decreasing the historical performance results of the index.

Past performance may not be indicative of future results and the performance of a specific individual account may vary substantially from the composite performance. Therefore, no current or prospective client should assume that future performance will be profitable or equal the composite performance results reflected herein. In calculating account performance, ASFA has relied upon information provided by various sources, primarily the account's custodian(s).

Different types of investments involve varying degrees of risk, and there can be no assurance that any specific investment will either be suitable or profitable for a client or prospective client's investment portfolio. ASFA's investment strategies may involve above-average portfolio turnover, which could negatively impact the net after-tax gain experienced by an individual client. In the event there has been a change in a client's investment objectives or financial situation, he/she/it is encouraged to advise ASFA immediately.

For reasons including variances in portfolio account holdings, variances in the investment management fee incurred, market fluctuation, the date on which a client engaged ASFA's investment management services, and any account contributions or withdrawals, among other variables, the performance of a specific client's account may have varied substantially from the indicated ASFA portfolio performance results. In addition, the underlying individual mutual funds that has comprised, and will continue to comprise, the model programs have changed, and are subject to continued change, at the discretion of ASFA. Historical information pertaining to the underlying mutual funds and changes thereto is available from ASFA upon request.

All composite performance results are currently compiled by Orion Advisory Services, a third-party back office service bureau responsible for client statements, billing and performance reporting. ASFA also maintains all information supporting the performance results in accordance with regulatory requirements. Information pertaining to ASFA's advisory operations, services, and fees is set forth in ASFA's current disclosure statement, a copy of which is available from ASFA upon request. Information pertaining to any mutual fund that is a current component of an ASFA portfolio is set forth in each respective mutual funds prospectus, a copy of which is also available from ASFA upon request.

The above charts are intended to be illustrative only and are not, in and of itself, predictive of future performance. The portfolio's performance is based on the portfolio's history, inception through most recent quarter, net of management fees.

*A "0" in this field means the index or strategy has not recovered from its most recent drawdown.

Account Exclusion Policy

An account will be excluded from the composite if it meets any one of the following criteria:

1. The account was not fully invested in the model during the period. Not all securities were held or the cash position was 3% or more out of balance.
2. An addition or withdrawal was made during the period.
3. Management fees are not paid from the account.
4. Management fees for more than one account are paid from the account.
5. A non-standard Management fee is charged to the account.

Past performance is not necessarily indicative of future results
